

DATACELL 1

DataCell provides battery voltage and state of charge (SoC%) information for up to 4 independent battery banks. DataCell uses Merlin's unique battery monitoring algorithms and data models to provide super accurate data that (unlike all other monitors) never runs out of synchronisation with your batteries.

DataCell may be used as a normal battery monitor (using optional display panel or supplied PC software), or as a discrete stand-alone module for system automation, data logging, or reporting to an RS232/CANbus data network (optional).

DataCell is currently employed in a vast array of applications including:

- vehicles with CAN Bus output to integrate to an existing multi-function display;
- boats with remote panel as a 1, 2, 3, or 4 channel battery monitor;
- UPS & back-up power with the RS232 interface building and managing the system, while DataCell also manages auto start/stop of back up generators & alarms with built in I/O.

Optional "plug & play" remote panels are available to allow viewing of voltage, state of charge % and alarms. Available with alphanumeric LCD display or large format red LED display. See kit part numbers below.

- **Model Based Battery Monitor** for up to 4 independent 12 or 24V battery banks 50-2000Ah.
- **Never runs out of synchronisation** with batteries & more accurate than shunt based Ah counter even when batteries are in standby for long periods.
- **Provides voltage and SoC%** and may be data logged using supplied software.
- **8 x configurable inputs & outputs** for controlling generator stop start, alarms, load shedding etc.
- **Independently verified accuracy** by leading authorities including EnerSys, US Army Tardec, BAE Systems, and General Dynamics.
